IP Subnet Calculator
Calculator: ip-subnet-calculator | Engine version: 1
Raw engine values: full numeric precision; no display rounding or sampled rows.
Units appear only where supplied by the calculation or bound display metadata.
Embedded Unicode glyphs are readable.
Unsupported characters and controls use explicit Unicode escapes.
Tagged PDF; PDF/UA conformance: UNVERIFIED.
Text follows document order; charts include complete numeric text alternatives.

INPUTS
IPv4 address
input["address"] = "192.168.1.10"
CIDR prefix
input["prefixLength"] = 24

RESULTS
Subnet addresses [addresses]
output["value"] = 256
output["steps"][0] = "IP Subnet = 256"

METHODOLOGY
Deterministic calculation using the reviewed Technology & Computing engine.\u000aTechnical calculation revision: technology.ip-subnet@1\u000a\u000aIPv4 subnet size from an address and CIDR prefix; the result reports the total IPv4 address count represented by the supplied subnet.\u000aNetwork size = 2^(32 − prefix length)

DECLARED FORMULAS
ip-subnet-calculator: Network size = 2^(32 − prefix length)
IPv4 subnet size from an address and CIDR prefix; the result reports the total IPv4 address count represented by the supplied subnet.

SOURCES
RFC 4632 — Classless Inter-domain Routing (CIDR)
https://www.rfc-editor.org/rfc/rfc4632
CIDR uses an IPv4 prefix length from 0 through 32; a prefix describes a power-of-two-sized block from one through 2^32 addresses.
